OmniPriv

DATA SHEET

OmniPriv's Privileged Access Management

Enterprise-Grade PAM for Modern Infrastructure

OmniPriv delivers complete privileged access lifecycle management — from credential vaulting and session isolation to AI-driven threat detection and regulatory compliance — in a unified, agentless platform deployable on-premise across any enterprise environment.

80+	8	Zero	100%
Requirement Points Covered	Core Capability Modules	Agents Required	Encrypted Credential Vault

1. Infrastructure & Deployment

Flexible on-premise deployment across any enterprise environment

Feature	Description
On-Premise Deployment	Deploys on-premise supporting VMware, Red Hat, and OpenStack/OpenSource-based infrastructure platforms
Agentless Architecture	No software agents required on devices, servers, or user workstations. Zero additional operational burden or complexity introduced
Browser-Based GUI	Web interface runs on all updated versions of Edge, Chrome, Firefox, and Safari
CLI & Web Interface	Full platform control available via both command-line interface and browser-based web console
Offline Device Credential Management	Manages and maintains credentials for devices not frequently connected to the corporate network
Unified Administration Console	Centralized management within a single user interface and central credential repository — no multi-console management required
Software Appliance	Delivered as a software-based appliance for streamlined, hardware-agnostic deployment
High Availability & Redundancy	Docker-based health checks with auto-restart, WebSocket heartbeat monitoring, multi-container service isolation, database replication, load balancing, and multi-instance clustering. No single point of failure
Distributed Architecture with Centralized Control	Zone model represents remote network segments; Gateway model acts as SSH proxy per zone. All distributed segments managed from one unified control plane
Network Architecture Documentation	Technical architecture diagrams showing network communications and rules for remote systems management provided upon request
Multi-Tenancy	Strict tenant isolation via org_id on every resource. Per-organization RBAC, roles, and member management. ROOT, DEFAULT, and SYSTEM orgs supported out of the box
Secondary Security Password	Secondary Security Password feature enforced as an additional layer for Password Vault access
Break-Glass Emergency Access	Built-in break-the-glass procedure to bypass the PAM solution in emergency situations while maintaining full audit trail
Enhanced Disaster Recovery	Enhanced break-glass procedure restores credentials without restoring the entire system. Granular backup and restoration capabilities minimize downtime
Gartner Magic Quadrant	OEM recognized in the Gartner Magic Quadrant for Privileged Access Management

2. Password & Credential Management

Automated credential lifecycle management at enterprise scale

Feature	Description
Automated Credential Rotation	Policy-driven rotation with configurable recurrence, rotation period, and daily start time. Configurable globally or per platform/policy
SSH Key Management	Full SSH key lifecycle — store, rotate, and push key pairs to assets via Change Secret automation engine. Private keys are encrypted in vault and never exposed outside the system. User self-service SSH key reset via email workflow
One-Time Password Enforcement	Enforces single-use passwords with automatic credential rotation immediately after each use
Credential Validation & De-sync Resolution	Verify Account Secrets automation actively tests stored credentials against live assets. Change Account Secrets task automatically pushes corrected passwords when de-sync is detected. Vault updated and re-verified without manual intervention
Automatic Password Reconciliation	Scheduled reconciliation plans detect and reconcile out-of-sync or lost passwords automatically. Connects directly to asset, pushes new password, stores updated credentials back in vault. No external restore utilities required. MFA required to view updated credentials
Password Groups	Administrators define groups where all member accounts automatically share the same password value. Updates propagate to all linked accounts with matching secret types. Managed directly from the Password Groups console page
Password History	Full versioned credential history maintained and accessible by approved users for a configured retention period
Bulk Onboarding Enrollment	Mass enrolment of privileged entities with automatic provisioning of all built-in accounts, privileges, rights, and permissions to the organizational standard
Mobile Client — TOTP & Vault Access	Built-in mobile client accessible from any mobile browser without installation. Supports TOTP-based 2FA, ticket approvals, geofencing controls, and role-based vault access — sensitive credentials only reachable by authorized roles

3. Application Security & Encryption

Zero-trust credential protection with enterprise-grade encryption

Feature	Description
Multi-Factor Authentication	Integrates with MFA for strong authentication including Biometric, Hardware Token, TOTP, SMS-based 2FA, and Email-based OTP
HSM Integration & Credential Encryption	Credentials protected with encryption and Hardware Security Module (HSM) integration. All sensitive data encrypted in transit and at rest
Encrypted Inter-Component Communication	All communication between system components is encrypted. No plaintext transmission at any layer
Encrypted Backups with Secure Key Management	Fully encrypted backups with independent, secure key management ensuring backup integrity and confidentiality
Role-Based Access Isolation	Administrators strictly cannot access credentials or approve requests outside their defined role. Role boundaries enforced at every access layer
Tamper-Proof Audit Storage	Audit records and events stored in secure, tamper-proof storage ensuring integrity and non-repudiation

Feature	Description
No Hard-Coded Credentials	Platform contains zero hard-coded credentials. All secrets are vault-managed and fully auditable
SHA-256 / SHA-512 Encryption	All sensitive data encrypted at rest and in transit using SHA-256 and SHA-512 encryption mechanisms
Adaptive MFA with AI Keystroke Anomaly Detection	AI-based anomaly detection engine continuously analyzes keystroke dynamics during every login. Evaluates typing rhythm, speed, and patterns against the user's behavioural baseline. Automatically triggers MFA even when valid credentials are entered if a behavioural anomaly is detected. Silent and transparent to legitimate users
Independent Cryptographic Key Backup	SECRET_KEY generated at installation must be stored externally and independently from the platform. Loss of key renders encrypted data unrecoverable. Same key maintained across upgrades and migrations

4. Enterprise & Identity Integration

Seamless integration with your existing enterprise ecosystem

Feature	Description
Ticketing System Integration	Built-in ticketing system supporting 6 request types: General, Asset Permission, Application, Command Confirm, Login Confirm, and Login Asset Confirm. Each type maps to a configurable multi-level approval workflow with automated notifications
Pre-Access Ticket Verification	Ticket verification enforced as a mandatory prerequisite before any privileged credential is released. Real-time status check — pending, rejected, or closed tickets automatically block credential access. Every retrieval tied to a valid approval record
Automatic Ticket Creation on Retrieval	A ticket and full approval workflow are automatically triggered on every privileged password retrieval request. Assignees notified immediately. Credentials not released until approval is granted. Every retrieval logged and linked to ticket for audit traceability
SIEM Integration	Forwards privileged access events to SIEM platforms in real time for centralized security monitoring and correlation
Identity Management Integration	Integrates with enterprise Identity Management systems for user lifecycle management and provisioning
LDAP / Active Directory Integration	Bidirectional sync with LDAP/AD directories. Automatic user and group provisioning. Supports user entitlement management via directory integration
RDP / SSH / VNC / HTTP Proxies	Supports RDP, SSH, VNC, and HTTP proxies. Users can access Password Vault based on their privileged level in addition to standard connections

5. Privileged Session Management

Complete visibility and control over every privileged session

Feature	Description
Session Recording & Monitoring	All privileged sessions fully monitored and recorded. High-fidelity video playback stored securely with controlled access. No agent reliance required
Session Isolation	Air-gap enforced between target devices and internet-connected user workstations. Credentials never disclosed to end users or transmitted to their machines
Multi-Platform Support	Session recording and isolation across SSH, RDP, VNC, HTTP, and database protocol sessions
Concurrent Session Scaling	Scales to support high volumes of simultaneous privileged sessions without additional licenses or appliances
Contextual & Searchable Session History	Session recordings are contextual and fully indexed. Searchable after the fact for compliance review, investigation, or audit
Session Controls & Automated Actions	Session management can prevent specific user actions and trigger automated responses on session events (e.g., auto-terminate on policy violation)
Secure Session Storage & Playback	Session recordings stored securely with strictly controlled access and full playback capabilities for authorized reviewers
High-Risk Activity Flagging	Suspicious or high-risk privileged activity flagged automatically for security operations team review
Script Monitoring	Every script executed during a privileged session is monitored and logged. All actions performed by scripts are captured in the audit trail
Native Client Support	User experience maintained — administrators can use their preferred clients and tools without workflow disruption
HTTP Session Monitoring	Granular HTTP request-level monitoring and logging beyond simple video recording. Historical Sessions stored with detailed activity logs
Database Query Controls & Dynamic Data Masking	Query blacklist/whitelist controls allow administrators to permit or block specific database queries. Dynamic data masking automatically hides sensitive fields in query results for non-privileged users. Works with native local database clients via transparent proxy — no jump server, extra hardware, or OS required. Available with additional license only

6. Workflow & Access Control

Structured, policy-driven privileged access with full approval governance

Feature	Description
4-Eyes Approval Principle	Minimum two independent approvers required before access is granted. No user can self-approve their own privileged access request. Multi-level approval rules configurable per workflow. Notifications dispatched to all approvers at ticket creation
Mobile & Email Approvals	Privileged access requests, approvals, and credential retrieval supported from mobile devices. Approvals via web GUI, mobile client, or email link — no login required for email approvals

Feature	Description
Multi-Level Flexible Workflows	Configurable multi-level approval chains supporting multiple approvers per step. Each approval level must complete before request progresses to the next stage
Time-Based Workflow Conditions	Workflows, policies, and approval rules configurable based on time-of-day or calendar-based conditions
Temporary Privileged Account Assignment	Account Authorization configured for a specific timeframe and target asset. ACL-based mapping grants temporary privileged access only. System automatically reverts user to standard restricted account on expiry. Least-privilege preserved as the enforced default throughout
Application Credential Management	Eliminates, manages, and protects privileged credentials embedded in applications and scripts. Automatically rotates hard-coded passwords in configuration files, databases, registries, Windows Services, scheduled tasks, and IIS App Pools
Zero-Latency Application Credential Handling	Critical applications retrieve credentials without introducing latency or reliance on remote repositories
Application Authentication & Protection	All applications requesting credentials are authenticated. Protected against unauthorized changes to prevent credential interception
API Rate & Access Controls	RPS (Request Per Second) limiter, Client IP/CIDR allowlist, Time Limit, and Usage Limit controls on all application token requests to manage server load and prevent abuse

7. Audit, Reporting & Compliance

Complete privileged account accountability for regulatory and internal requirements

Feature	Description
Full Privileged Account Accountability	Complete, tamper-proof audit trail of all privileged account usage. Every action logged with user, time, asset, and outcome
Exclusive Session Access Control	Option to restrict accounts to one concurrent session, preventing shared or parallel privileged access
Policy Compliance Alerts	Automatic alerts generated when a privileged account is found non-compliant with defined credential policies
Detailed & Scheduled Reporting	Comprehensive reports covering entitlements, user activity, asset inventory, and compliance posture. Reports schedulable for automatic generation and delivery
SOX Compliance	Supports Sarbanes-Oxley Act controls for financial system access governance and privileged account oversight
PCI-DSS Compliance	Meets Payment Card Industry Data Security Standard requirements for cardholder data environment access control
HIPAA Compliance	Supports Health Insurance Portability and Accountability Act requirements for protecting sensitive health data access
Basel II Compliance	Addresses Basel II operational risk management requirements for financial institutions
MAS TRM Compliance	Meets Monetary Authority of Singapore Technology Risk Management guidelines

Feature	Description
NIST 800-53 Compliance	Aligned with NIST Special Publication 800-53 security and privacy controls
FERC/NERC Compliance	Supports Federal Energy Regulatory Commission and NERC CIP standards for critical infrastructure
GDPR Compliance	Supports General Data Protection Regulation requirements in the context of protecting sensitive personal data

8. Threat Detection & Response

Proactive intelligence against insider threats and privilege abuse

Feature	Description
Behavioural Analytics Engine	Intelligence-based analytics continuously monitoring privileged account activity to detect suspicious patterns and behavioural anomalies
Insider Threat Detection	Continuous monitoring of privileged user behaviour for signs of misuse, compromise, or policy violation by internal actors
PAM Bypass & Backdoor Detection	Detects attempts to circumvent privileged access controls, exploit undisclosed accounts, or establish unauthorized backdoor access
Lateral Movement Prevention	Privileged administrators restricted to only their specifically authorized applications on target systems. Prevents unauthorized traversal across the infrastructure
Credential Theft & Harvesting Detection	Detects credential harvesting attempts, unusual credential access patterns, and exfiltration indicators in real time
Automated Threat Response & Alerting	Triggers automated remediation actions and real-time alerts on confirmed threat events. Security operations team notified immediately on high-risk activity

9. Regulatory Compliance Summary

Standards and frameworks supported out of the box

Regulation / Standard	Full Name	Applicability
SOX	Sarbanes-Oxley Act	Financial system access governance and privileged account audit
PCI-DSS	Payment Card Industry Data Security Standard	Cardholder data environment access control
HIPAA	Health Insurance Portability and Accountability Act	Protected health information access governance
Basel II	Basel II Accord	Operational risk management for financial institutions
MAS TRM	MAS Technology Risk Management Guidelines	Technology risk controls for Singapore financial entities
NIST 800-53	NIST Special Publication 800-53	Federal security and privacy controls framework
FERC / NERC CIP	Federal Energy Regulatory Commission / NERC Critical Infrastructure Protection	Critical energy infrastructure security standards
GDPR	General Data Protection Regulation	EU data protection and privacy for sensitive personal data
ISO 27001	Information Security Management System	International information security standard

10. Platform Specifications

Technical deployment and architecture specifications

Specification	Details
Deployment Model	On-Premise (VMware, Red Hat, OpenStack / OpenSource-based platforms)
Architecture	Agentless — no software agents on devices, servers, or endpoints
Interface	Web GUI (browser-based) + CLI (command-line interface)
Browser Support	Microsoft Edge, Google Chrome, Mozilla Firefox, Apple Safari (latest versions)
Mobile Client	Built-in, browser-based mobile client — no app installation required
High Availability	Multi-container with Docker health checks, database replication, load balancing, clustering
Multi-Tenancy	Yes — org_id isolation per resource, per-org RBAC, ROOT/DEFAULT/SYSTEM orgs
Encryption — In Transit	SHA-256, SHA-512; all inter-component communication encrypted
Encryption — At Rest	SHA-256, SHA-512; full vault encryption via SECRET_KEY
HSM Support	Yes — Hardware Security Module integration for credential protection
MFA Methods	TOTP, Biometric, Hardware Token, SMS OTP, Email OTP, Push Notification
Session Protocols	SSH, RDP, VNC, HTTP, Database (native client via transparent proxy)
Backup	Fully encrypted backups with granular restore capability
Disaster Recovery	Break-glass + enhanced credential restore without full system restore
Proxy Support	RDP, SSH, VNC, HTTP proxies with Password Vault access by privilege level
Ticketing	Built-in (6 request types) + external ticketing system integration
Directory Integration	LDAP, Active Directory (bidirectional sync, automatic provisioning)
SIEM Integration	Real-time event forwarding to SIEM platforms
API Security	RPS limiter, IP/CIDR allowlist, time limits, usage caps on token requests
AI / Analytics	Keystroke anomaly detection, behavioural analytics, insider threat detection
